McCullough Robertson reduces carbon footprint

27 November, 2011 Lawyers Weekly 0 comments

McCullough Robertson has been commended by the Australian Legal Sector Alliance (AusLSA) for reducing its total carbon emissions by 4.2 per cent this year, despite an increase in staff.

As one of the Alliance's eight foundation members, McCullough Robertson has, for the past two financial years, reported its carbon footprint alongside other member firms.

It was one of three firms of the eight executive members to reduce its overall emissions and emissions per head.

"While the overall trends show an increase in emissions, we are pleased that we have not followed that trend," McCullough Robertson CEO David Goener said.

The firm decreased its paper consumption per head by 25.3; its business travel carbon emissions by 9 per cent; and its electricity per head by 2.8 per cent.

Earlier this month, the firm installed a range of new printers that are intended to further reduce paper consumption through intelligent printing capabilities.

"By making a smaller footprint we are looking forward to a bigger future," Goener said.
